

Update 7

After the semester final, we got the body mounted onto the chassis and got the rear axle done. Now we have to finish making plates for the nose cone and the back piece of the body. The exhaust pipe is in the process of getting finished. Wiring still has to be made. Fire walls are being measured to make sure it's not going to waste. We still have to finish up our gear box. Gas tank needs to be mounted onto the chassis. The belt will be used when the rear axle and the engine is setup correctly. Two brakes are on the front wheel and one brake will be on the back, left side of the wheel.
