

Team CLC

September 20- 31, 2010
Update 2

Overall

We did a lot of work on the chassis the past two weeks. The Chassis is being built, CAD models are being created for the back end, and our team is working together to be as efficient as possible.

Chassis

We have started cutting and lying out the chassis. We have completed the bottom and have welded the two roll bars, middle bar on the back, front square, as well as a couple of the front bars have been added to the car. Sean is teaching Alex to weld while the others are continuing to practice their welding skills.

C.A.D. The computer models of our cars are almost finished and research is being done to improve old models.

Trouble Shooting

A shortage of welders is making the welding process difficult at times, but by having one hour pre cut all the necessary pieces for the next day, our team has been able to work efficiently in constructing the majority of the chassis.
